Business Database for Statistic (BDS) of Vietnam

By: Do Ngoc Ha
Methodology Standard and ITC Dept
General Statistical Office, Viet Nam
**Introduction**

- General Statistical Office (GSO) was responsibility to conduct and public all indicator in National Statistical System

- Statistical data sources:
  - Sample survey/Census
  - Reporting regime
  - Administrative records: all most is not to date, data sharing between Ministry is limited.

- Currently, GSO has two data that are connecting from administrative records:
  - Import/export data from Custom Agency
  - Business database for Statistic
Introduction

- BDS was built from 2002 under Experience of Sweden
- Data source:
  - Tax registration data: information of tax paying
  - Enterprise registration data: information of enterprise on establishment license
  - Enterprise survey data: include identify information of enterprise and the business result of enterprise
- BDS is enterprise sample frame
Data is mapping between 3 Agencies
- Code and classification: while GSO is using new code and classification version, Tax office and Business Registration Agency are using old version: Administrative code, Industry standard classification
- Difference disaggregation: GSO is using legal, ownership and sector to create type of enterprise but Tax Office is using Category, level code, economy

Tax information is not shared to GSO: Tax office do not update full tax information of all enterprise at country level, their data is purposed for their business only.

There are not data sharing policy of Government

Enterprise always move their office (address is dynamic)
Solution

- Data is transferred every month from Tax office and Business registration Agency to GSO.
- Tax data and enterprise registration data is needed to convert before update to the system. CC_DB (classification and code database) likes metadata that contain all code, classification and code mapping.
- After 3 years: GSO conducts to check address of enterprises in the field.
THANK YOU!
