

Policy Instruments to Promote Sustainable Agriculture

SVRK Prabhakar IGES, Hayama, Japan

PRESENTED AT CAPSA-UNESCAP POLICY ANALYSIS WORKSHOP: TRANSITION TOWARDS SUSTAINABLE AGRICULTURE IN THE CONTEXT OF THE 2030 AGENDA FOR SUSTAINABLE DEVELOPMENT-STRATEGIC IMPLEMENTATION, FOLLOW UP AND REVIEW, BOGOR, INDONESIA. 15-17 NOV 2016

OUTLINE

- Typology of policy instruments
- Detailed discussion on specific instruments
 - Subsidies
 - Insurance
 - Carbon sequestration, removing access barriers etc.
 - Metrics based incentivization
 - Certification
- Conclusion

INSTRUMENTS FOR PROMOTING SUSTAINABLE AGRICULTURE

- Product certification
- Agricultural insurance
- Subsidies
- Labelling and logos
- Payment of ecosystem services

- Regulations, guidelines and controls
- Positive policy support (programmatic and donor driven funding)
- Information provision
- Removal of barriers (e.g. to market access)
- Access to capital
- Carbon sequestration, trading & credits Ensure open and competitive markets
- •Taxation and exemptions
- Removal of perverse incentives
- Cash transfers

- Land tenure related policies
- Indicator based metrics

MAJOR AGRICULTURAL SUBSIDIES

AGRICULTURAL SUBSIDIES

Regional distribution of agriculture subsidies (World Watch Institute and OECD)

Decline in total support for agriculture in OECD countries

SUBSIDY SITUATION IN ASIAN-OECD COUNTRIES

- Developed countries in^C Asia have continuously reduced the producer and other forms of support.
- **Developing countries** continue to increase support for agriculture while Vietnam case can provide an example (as a result of Doi Moi reforms?)

SUBSIDIES FOR SUSTAINABLE AGRICULTURE?

Country	Example and nature of subsidy
India	 Organic agriculture, subsidy for organic and bio fertilizer and pesticide manufacturers under National Project on Organic Farming for capital investments (e.g. compost production units) Insurance premium subsidy under national crop insurance program Establishing scientific storage capacity under Integrated Scheme on Agricultural Marketing Sustainable agriculture investments under National Mission on Sustainable Agriculture (e.g. soil testing labs)
China	Private sector subsidize the transition to organic agriculture by input subsidies (nearly 57%) (ADB 2015)
ASEAN	GAP certification is fully subsidized by national governments

- Subsidies are increasingly been targeted to promote sustainable agriculture but the progress is slow and is not sufficient to fully incentivize the transition.
- However, they are still blanket subsidies and leading to leakages and other imperfections affecting the agriculture negatively than benefiting.

ALTERNATIVES TO CURRENT FORM OF SUBSIDIES

Investment in capacity building of farmers including extension services

 Investment in risk mitigation instruments including irrigation facilities, better crop varieties, risk insurance and weather services

Targeted subsidies instead of blanket subsidies
 Conditional cash transfers to targeted farmers

CLIMATE IMPACTS CROP PRODUCTION: PADDY IN INDIA

IMPACT ON FARM INCOME: IMPACT OF 2010 DROUGHT ON NPL OF BANKS IN INDIA

- Increase in farm loan defaults (figure on the right).
- Increased burden on government: farm loan waivers to the tune of 14.4 billion US\$ in 2008 by GOI, in comparison GOI spent only ~163 million USD on insurance in 2008.

MEANS OF BUFFERING IMPACTS AND ISSUES

Means	Issues	
Better crop varieties	Often costly, spurious seeds, IPR and need to buy every year	
Loan waivers	Costly on national budget, political influence, no-proper scrutiny of loss differentiation, mostly rich gets benefited and corruption	
Expand irrigation facilities	High investment costs, declining rainfall and increasing rainfall variation may not buffer especially for the tail-end farmers	
Livelihood diversification	Poor rural economy with low demand especially during drought and flood times; may promote migration	
Input subsidies	Often rich gets benefited; high cost to the government; not useful when conditions are not congenial for cropping	
There is a need for stabilizing financial loss in the event of the failure of the above		

AGRICULTURE INSURANCE

- In agriculture sector, primarily introduced as a means of buffering economic shocks from natural hazards
- If designed well, insurance can provide several benefits
 - Emphasis on risk mitigation compared to response
 - Provides a **cost-effective** way of coping financial impacts
 - Covers the **residual risks** uncovered by other risk mitigation mechanisms.
 - Provides opportunities for **public-private partnerships**.
 - Helps communities and individuals to quickly renew and restore the livelihood activity.
 - Depending on the way the insurance is designed, the insurance mechanism can address a variety of risks of climatic and non-climatic nature.
 - Reduced burden on government

Arnold, 2008; Siamwalla and Valdes, 1986; Swiss Re, 2010

WAYS IN WHICH INSURANCE CAN PROMOTE SUSTAINABLE AGRICULTURE

- Change in the behaviour of farmers: By making adoption of best practices obligatory/accompanying agricultural insurance
- Reduced economic impacts can be redirected to invest in better management practices
- Capacity building farmers who enrolled into insurance by the collaboration between insurance delivery agencies and agriculture extension agencies, farmer cooperatives and self-help groups
- Incentivizing reduced insurance premium prices for the farmers adopting BMPs.

We don't have evidence for these happening yet!

CURRENT INSURANCE COVERAGE

Non-life Insurance Premiums

US\$ Billions

- In contrast, Asia and Africa have one of the highest agricultural populations in the world
- The rural areas in these regions are reported to have highest poverty and seasonal unemployment where buffering income fluctuations will have significant socio-economic impacts

Source: Global Premiums Iturrioz, 2010

WHY INSURANCE HAS NOT SCALED UP?

- High residual risks in agriculture: Only 35-40% of agriculture is irrigated in Asia; low expansion of drought and flood-tolerant varieties; poor extension systems
- Inefficiencies attributable to adverse selection and moral hazard
- **Poor availability of data** to assess risks for designing effective risk insurance systems (e.g. weather data and data on crop loss)
- Willingness to pay: Economic, cultural and perceptional issues with both people at risk and policy makers
- Lack of **trust** among the insured on insurance providers
- Poorly developed re-insurance industry
- And so on...
- <u>High insurance costs</u>: Costs to whom and compared to what alternative risk management strategy? How to overcome these limitations?

ADDRESSING HIGH INSURANCE COSTS

Subsidy on Premium

Country	% Premium Subsidy
China	60%
Japan	49%
India	30%
Pakistan	70%
Philippines	100%*
ROK	50%
' O	for subsistence farmers only* FAO 2011

 Most governments address the insurance costs through subsidy on premium. Premium subsidies rose
 250 percent over 2007 subsidy levels in the Asia Pacific region.

- Advantages
 - Easy to implement
 - High political impact

Disadvantages

- The real cost of risk is not conveyed to farmer
- Possibility of high risk seeking behaviour
- Disproportionately benefits rich farmers
- Overall insurance costs remain same or even higher

ADDRESSING HIGH INSURANCE COSTS Technology: Index insurance

- Reduction in transaction costs
- Greater reach to all size of farms (greater coverage)
- Reduces moral hazard and adverse selection problems
- Reduces distress sales due to quick insurance payouts

CCAFS 2015

INNOVATIVE SOLUTIONS

Combining Insurance with Payment of Ecosystem Services

- Payment of ecosystem services and carbon capture and sequestration proceeds could be linked to insurance premiums and or investments made on risk mitigation options that can generate substantial PES proceeds.
- E.g. certain types of intensive row-cropping systems and ecological farm scapes can promote ecosystem services such as a clean and well-regulated water supply, biodiversity, natural habitats for conservation and recreation, climate stabilization, and aesthetic and cultural amenities such as vibrant farm scapes etc. (Robertson et al. 2014).

• Combining insurance with social security programs

- 40% of global population is not protected and 75% are inadequately protected
- Combining social security and insurance can help extend social protection to under-served populations and can reduce the overall costs of insurance for the vulnerable sections of the population while extending financial inclusion benefits

PAYMENT OF ECOSYSTEM SERVICES & C SEQUESTRATION

- To recognize and reward ecosystem services in various forms.
- There is a large potential for expanding these tools to wider agricultural areas recognizing the multiple functions of agriculture especially disaster risk reduction.
- These tools are yet to be applied in conventional agriculture but have successfully been applied in scenarios where natural ecosystems and agriculture are in close interaction such as in agro-ecological farming systems (e.g. Sato Yama).

0

Zhang et al., 2007

CARBON SEQUESTRATION POTENTIAL OF ASIAN SOILS AND ACCRUED REVENUE FOR FARMERS FROM CARBON MARKET

- In terms of carbon sequestration in agricultural soils, tropical soils offer limited potential for carbon sequestration but nevertheless helps to build carbon to levels possible in the given agro-climatic conditions.
- Soils in Asia are highly depleted of soil carbon due to intensive cultivation practices. Measures such as zero and reduced tillage can provide such opportunity.
- Carbon credits are on continuous decline since 2010 but may resume during the implementation phase of the
 Paris Agreement.

What are the costs?

What about the spill over effects?

- Global carbon sequestration potential of agricultural soils = 0.4-1.2 Gt/yr (Lal, 2004)
- Global technical potential of CO2 until 2030 = 5500-6000 Mt CO2/yr (Smith et al., 2008 i.e. IPCC)
- Highest potential = 0.8-1.0 Gt/yr (Hansen et al, 2013)
- Asian soils (rough estimate) = 0.08-0.1 Gt/yr
- Total revenue at current carbon exchange prices = 2.5-3.0 USD/ha/farmer/yr

METRICS FOR PROMOTING SUSTAINABLE AGRICULTURE

- Large number of sustainable agriculture C indicators have been identified in the literature
- There are no comprehensive approaches that have systematically assessed these indicators for on-the ground decision making
- Major gaps in the proposed indicators are low emphasis on economic and social impacts, biodiversity and ecosystem services and disproportionately stress physical elements of agricultural system

HOW TO PRIORITIZE AND DEPLOY SUSTAINABLE AGRICULTURE INDICATORS?

LOCAL ADAPTATION INDEX (LAIN) APPROACH

Prioritized

Quantified

Max(Score)

		Indicators (Bangladesh)		Indicators (Bangladesh)	Value	Range (Min Max)	Score	Weight

PRIORITIZING THROUGH MCA TECHNIQUES: BANGLADESH-DROUGHT, MALE

CERTIFICATION: PROS AND CONS

- Ability of producers to access to markets where such standards are enforced
- Price premiums and higher income
- Capacity-building of producers and stakeholders in the supply chain in aspects of food quality
- Reduction in food loss due to improved capacity and support services
- Increased consumer confidence and a better ability to create brand equity among the consumers and markets.
- Could alienate small and marginal producers who cannot afford or technically comply with formal certification schemes.

CURRENT STATE OF CERTIFICATION

	Governmental regulations/standards	Government certification	Affiliation/basis for national	Other certifications
			standards*	available *
Bangladesh	None	None	Mostly by foreign certifiers	SGS certification
China	China National Organic Product Standard (2005)	Organic Food Development Center of China (OFDC)	International Foundation for Organic Agriculture (IFOAM)	NOP, OCIA, JAS, EU
India	Indian national standards for organic products (2001-05)	APEDA (National Programme for Organic Production, National Project on Organic Farming)	IFOAM and EU	EU, NOP, CODEX, DAP Germany
Indonesia	Indonesia National Standard number 01-6729-2002	Badan Standardisasi Nasional (BSN) (the national standard agency), Otoritas Kompeten Pangan Organik (Organic Food Competent Authority, OKPO)	CODEX. Also refers to IFOAM, JAS, EU	IFOAM, JAS, EU
Japan	Japan Agricultural Standards of Organic Agricultural Products	Japan Agricultural Standards (JAS)	CODEX	
Malaysia	Skim Organik Malaysia SOM (national organic standard, MS 1529:2001)	SOM, Department of Agriculture Sarawak	IFOAM and CODEX	eu, nop, jas
Pakistan	None	None	Mostly by foreign certifiers	
Philippines	Philippine National Organic Standards for Crop and Livestock Production	Organic Certification Center of the Philippines, Bureau of Agriculture, Fisheries and Product Standards (BAFS)	Based on IFOAM and EU	
Republic of Korea	Yes	National Agricultural Products Quality Management Service (NAQS), Korean Food and Drug Administration (Transaction Certificate for Processed Organic Products)	CODEX	
Sri Lanka	None	None	Mostly by foreign certifiers	
Thailand	National Organic Standard Guideline for Crop Production	Organic Agriculture Certification Thailand (ACT)	IFOAM	EU, JAS, CODEX, NOP
Vietnam	Organic Agricultural Production	Ministry of Agriculture and Rural Development	None	

SUSTAINABLE AGRICULTURE CAPACITY (ORGANIC)

Certification agencies — OA as % of total agriculture — Percapita organic demand

There is a poor capacity for organic certification in most developing countries in Asia.

Legend: Certification agencies: 1=10-20: 2=20-30: 3=30-40: 4=40-50; 5=>50.

Organic agriculture (OA) as percentage of total agriculture: 1=0-0.4; 2=0.4-0.8; 3=0.8-1.2; 3=1.2-1.6; 4=1.6-2.0; 5=>2.0.

Per capita organic demand (million US\$): 1=0-5; 2=5-10; 3=10-15; 4=15-20; 5=>20.

ISSUES AND SOLUTIONS FOR CERTIFICATION

Issues	Solutions and limitations
High cost of certification for producers	Nationally funded programs, participatory Guarantee System, capacity building of cooperatives
Fragmented certification systems	Unified certification system based on the common principles underlying the existing certifications (e.g. EU Organic farming Logo); however, there is no consensus on the possibility of implementing such unified certification system
Monitoring and evaluation costs	Participatory Guarantee System (India, Vietnam etc), automation of certain verification processes; visitation by certification officer is a major bottleneck
Transition time from conventional to organic	Support services (e.g. extension and other information based support services) and subsidies on organic inputs

Moving focus from organic to other forms of sustainable agriculture: Fairtrade is helping by organizing small-scale farmers into groups, building their capacity to produce quality goods and linking them with the markets through the marketing of Fairtrade certified produce (Fairtrade, 2016). Through this initiative, in 2015, Fairtrade was able to link nearly 40,000 smallholder farmers in the Pacific region alone.

30

REMOVING BARRIERS: IMPROVING THE MARKET ACCESS

Country	Market access examples
Cambodia	Farmer-supermarket linkages, community cooperatives, training and capacity-
	building
China	Farmer—supermarket linkages, farmer associations, training and capacity-building
India	Contract farming, self-help groups, cooperatives, farmers markets, subsidies for
	investment in market infrastructure, information technology
Indonesia	Farmer field schools, participatory market chain approaches, contracts between
	farmers and market chain partners, capacity-building of farmers, farmer groups and
	farmer-private sector partnerships
Papua New Guinea	Farmer–private sector linkages, CODEX marketing standards, infrastructure
	improvement, Fairtrade certification schemes (also applicable in many other Pacific
	countries)
Philippines	Developing enterprises around special food produce, capacity-building, technological
	infusion, farmers cooperatives, farmer—trader linkages
Samoa	Fairtrade certification, capacity-building, market linkages
Thailand	Farmer to trader linkages, private sector linkages, and leadership of lead farmers

CONCLUSIONS

- Several policy instruments have been tried for sustaining agriculture in Asia
- Most of these policies can be used for promoting sustainable agriculture if they are targeted well
- There is still a need for systematic studies that compare most policies for their efficacy in promoting sustainable agriculture in country-specific and farmer-specific contexts to understand who lose and who win.
- There is a need to design and implement policies to promote other forms of sustainable agriculture (e.g. community supported agriculture, biodynamic farming etc) and ASEAN is doing well in this regard.

THANK YOU!
